

HOW TO USE DATA API

1.1 Get	country identifiers.	3
1.2 Sea	rch for a company (identification of a company in the database)	3
1.2.1	Search company by company info	3
1.2.2	Search company by one of the externalld	6
1.2.3	Search company by companyId	9
1.3. Che	eck product availability	11
1.4. Red	quest company identification.	15
1.4.1	Request the identification.	15
1.4.2	Request the needed product	17
1.4.3	Request all identifications	18
1.5 Ord	ering a product	19
1.5.1	Ordering a product for an identified company:	19
a.	Ordering a Full Report via companyId:	19
b.	Ordering a Snapshot report (light report) via externalld:	19
c.	Ordering a Sector Risk Assessment	20
d.	Ordering Financial products	23
1.5.2 Ordering a product for a company not identified		28
1.5.3	Ordering a product using Callback mechanism	29
1.5.4	Checking order status	30
1.5.5	Retrieving the data	31
1.6 Req	uest Monitoring/ Ordering a monitoring product	32
1.6.1 Or	dering a monitoring product without a callback mechanism for the notifications	33
1.6.2 Or	dering a monitoring product using CALLBACK mechanism for the notifications	34
1.6.3 Re	etrieving content of the report / product ordered via monitoring order	36
1.6.4 Re	etrieving monitoring notifications.	37
2. Use cas	ses	41
2.1	Ordering multiple products for same company	41
2.1.1	Ordering 2 assessments in one call	41
2.1.2	Ordering other products for the same company	49
2.2	Ordering Late Payment Index product for a company	54

How to use DATA API via OAuth2 - technical part

The main functional flows are represented in https://coface.github.io/DataAPI.html#process

After the proper authentication, always the customer needs to:

- start with Searching and identifying a company,
- check the products availability,
- order a product,
- check the status of the order and
- Retrieve the data.

All functional calls below can be found in the Postman collection uploaded under https://coface.github.io/DataAPI.html#documentation

Remark!! In the sample calls which follow, the variable {{dataAPIBaseUrl}} = https://icon-apitest.coface.com/dataapi-v1

Prerequisite!! In order to perform the following calls, you should already have an user connected via AWS Dev portal. Please check this https://coface.github.io/utilities/iCON API UserConfiguration DeveloperPortal.pdf , in case you do not have yet a connected and authorized user.

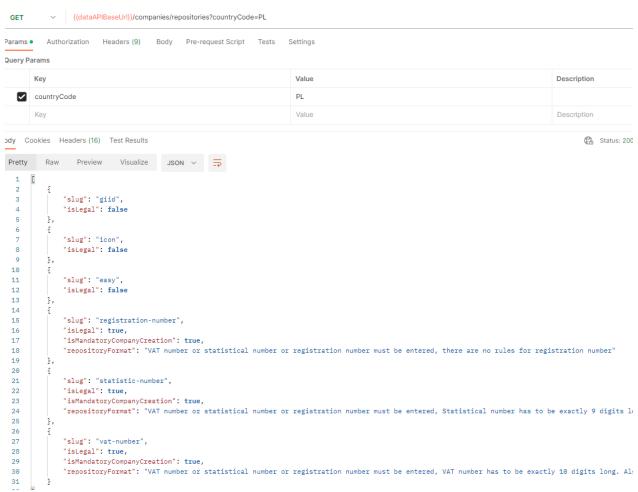

1.1 Get country identifiers.

- Allows to obtain details of identifiers in specific countries which can be used for unique company identification (check which identifier is legal per country)
- Request can be done by specifying country ISO Code and in return customer get list of identifiers used in specific country.

Request: GET {{dataAPIBaseUrl}}/companies/repositories?countryCode=PL

1.2 Search for a company (identification of a company in the database)

There are several options for searching and identification of a company:

1.2.1 Search company by company info

Allows to perform search by name and countryCode mostly. Search can be performed using **minimum** companyName (or parts of the name) and countryCode:

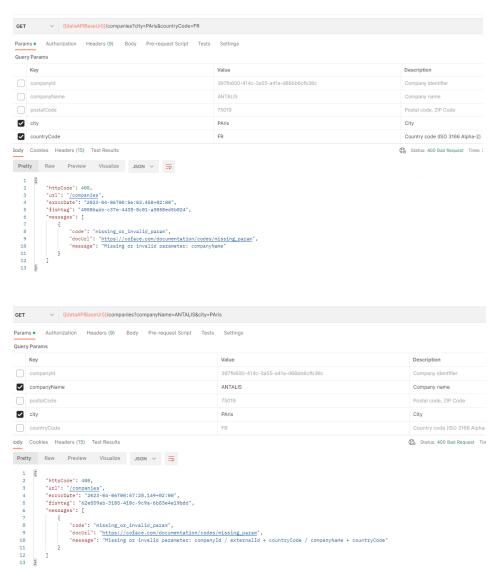

GET {{dataAPIBaseUrl}}/companies?companyName=ANTALIS&countryCode=FR=> 28 companies returned

If more information is provided, like postalCode and city, more accurate the search is and company is identified:

GET {{dataAPIBaseUrl}}/companies?companyName=ANTALIS&city=PAris&countryCode=FR => 6 companies returned

GET {{dataAPIBaseUrl}}/companies?companyName=ANTALIS&postalCode=75019&city=PAris&countryCode=FR => 1 result returned. Company is identified.

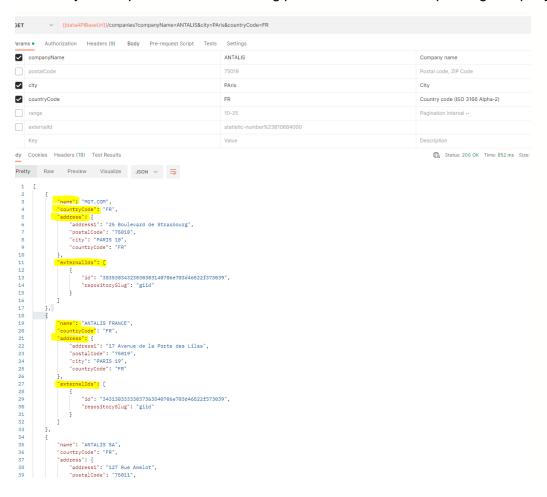

Error case: If combination companyName + countryCode is not provided, 400 Bad request is returned:

Success case – Returns list of companies found with the given criteria. For each company from the list, the response includes: name, countryCode, address and externallds.

Externallds can be also used further for better identification of the company, checking the availability of the products or for ordering products for that corresponding company.

1.2.2 Search company by one of the externalld

Allows to search for a specific company by providing combination of countryCode + externalld. Externalld can be one of the national identifiers or one of internal Coface IDs. It was either returned by previous method (using companyName + countryCode) either was already known (e.g.VAT number).

Parameter **externalld** will be used with value {repositorySlug}#{id}.

Response returns either 1 unique result or no results.

Important Remark related to identifiers:

Internal Coface identifiers:

iconNo= > the most recommended one as all identified researched companies have this identifier; The only drawback for this identifier is that when we are changing our external provider, iconNo values will change, but we will provide you the new iconNo values for your portfolio

easyNo=> can be used, but with the remark that not all of our identified companies have this identifier

giid=> is an unique identifier inside Coface, and it is based on the external provider id. You will have this identifier returned for all companies /countries where we have an external provider involved. For all other cases, this identifier is not present

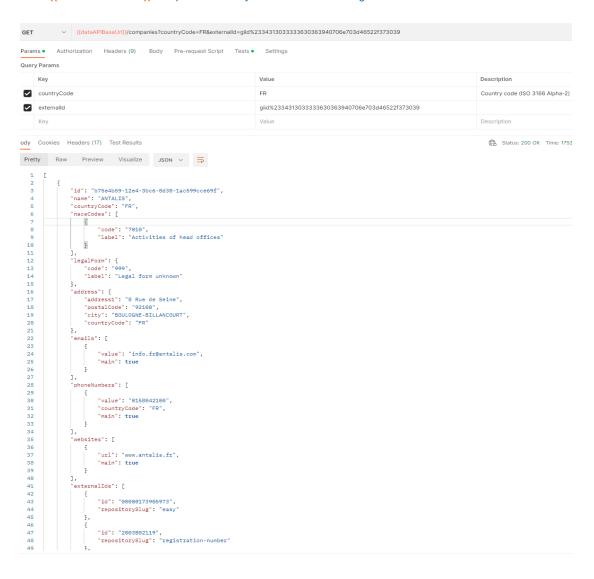

Legal Identifiers: vat-number, tax-number, registration- number, statistics-number. Important remark related to these identifiers is that they are not existing in all countries, not all our external providers allow search using them and for some countries they cannot be used for uniquely identifying the researched company.

Considering the above remarks, our recommendation is that the most reliable identifier in this moment is iconNo.

Identifying company using gild number:

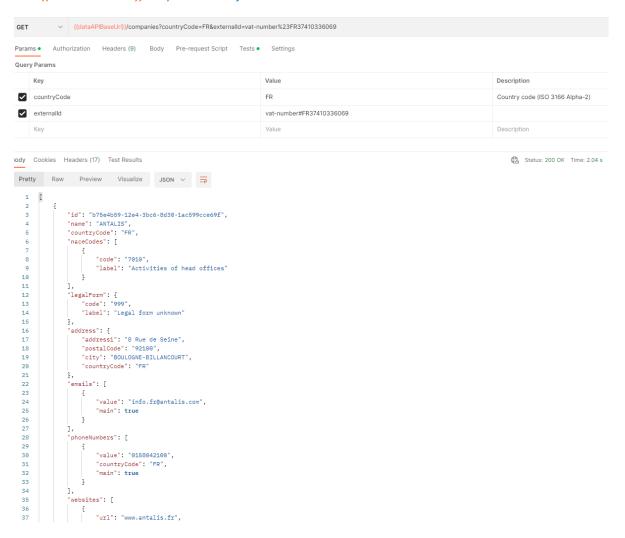

GET {{dataAPIBaseUrl}}/companies?countryCode=FR&externalId=giid%2334313033333630363940706e703d46522f373039

Identifying company using VAT number:

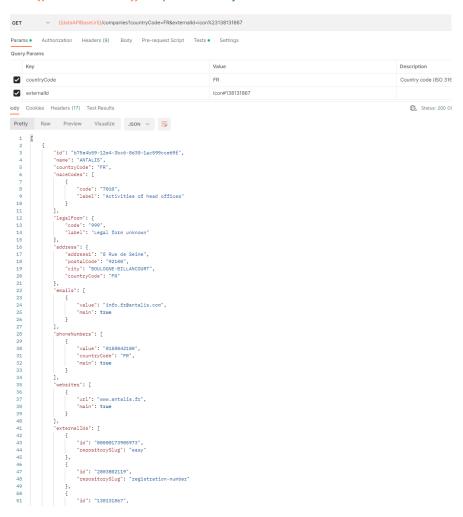

GET {{dataAPIBaseUrl}}/companies?countryCode=FR&externalId=vat-number%23FR37410336069

Identifying company using ICON number:

GET {{dataAPIBaseUrI}}/companies?countryCode=FR&externalId=icon%23138131867

1.2.3 Search company by companyld

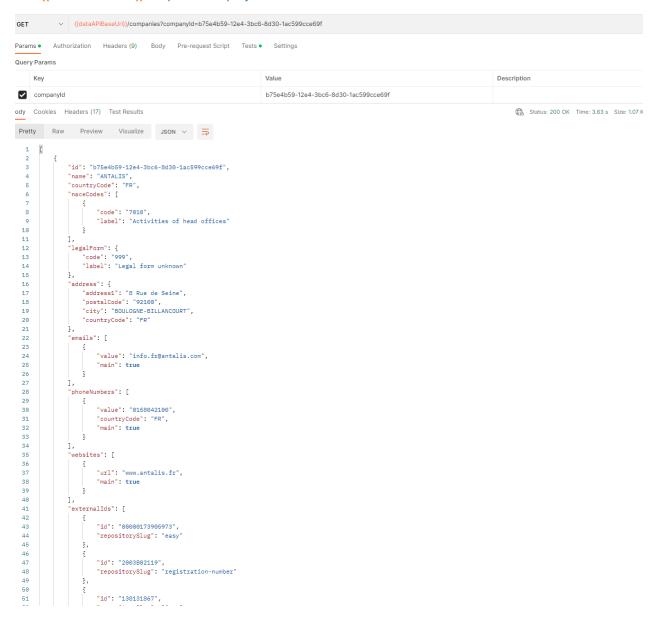

Allows to identify a company using the internal Coface id. This Id is known either without passing the precedent searches, either is returned when identifying the company as it could be seen in the previous methods.

If companyld parameter is provided, the other fields are ignored.

Important Remark: as the companyld is based on easy No, and not all our researched and saved companies have the easyNO, it is possible that not all your searched companies to have a companyld identifier returned.

GET {{dataAPIBaseUrl}}/companies?companyId=b75e4b59-12e4-3bc6-8d30-1ac599cce69f

In all these cases, response should be identical. One company is uniquely identified.

Response contains information about the company requested: internal id inside ICON, name, countryCode, naceCodes, legalForms, address, emails, phoneNumbers, websites and externalIds.

Reaching this point, it means that customers either uniquely identified the company and can go to the next step of checking the list of available products and order them or failed in finding company.

1.3. Check product availability

Once the company is identified, the next step to be done before ordering a corresponding product, is to check the availability of the products for that company and the possibility of monitoring each of the products.

There are several endpoints that can be used for this:

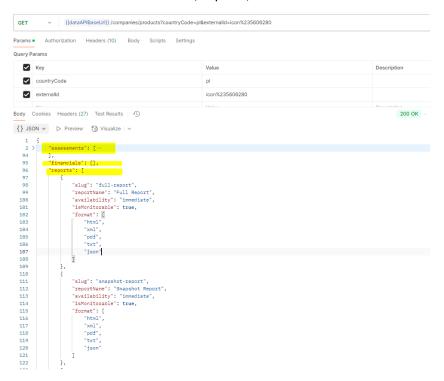

Check all products existing for a certain company:

Endpoint:

GET {{dataAPIBaseUrl}}/companies/products?countryCode={countryCode}&externalId={externalId#value}

Request should contain parameters that can help identify the company: companyId OR countryCode in combination with any of the idenfier: iconNo, easyNo, giid, vat-no, registration-number, tax-number, statistics-number

Response contains all products available for the company in combination with what is configured on customer profile based on the contract signed with Coface. All products are returned grouped into several sections: assessments, reports, financials

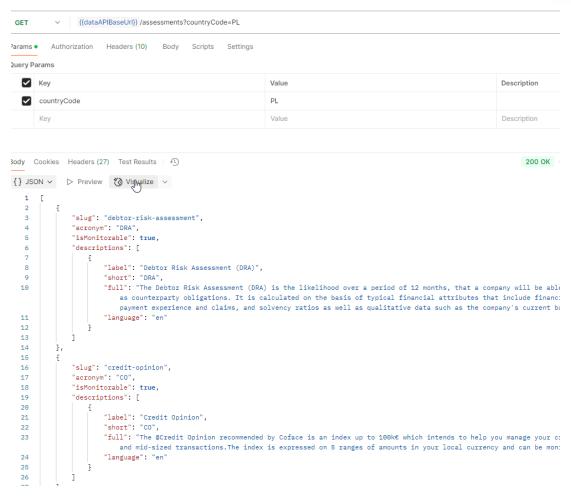

If a customer needs to check only a specific category of products, he can use specific endpoints for this:

Check all available assessments:

Endpoint: GET {{dataAPIBaseUrl}}/assessments?countryCode={countryCode}

Response: all assessment products available per country and visible based on contract

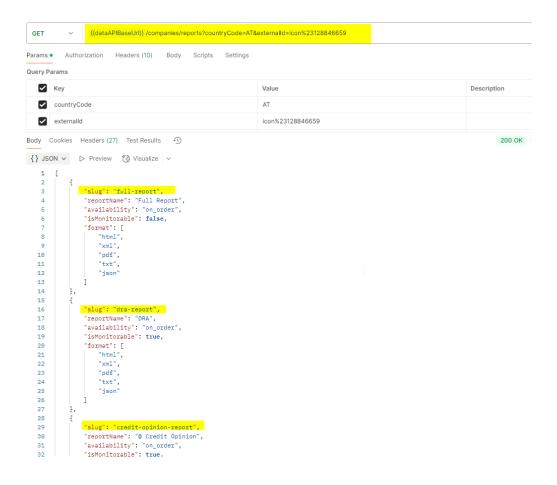

Check all available reports:

Endpoint: GET {{dataAPIBaseUrl}}/companies/reports?countryCode=AT&externalId=icon%23128846659

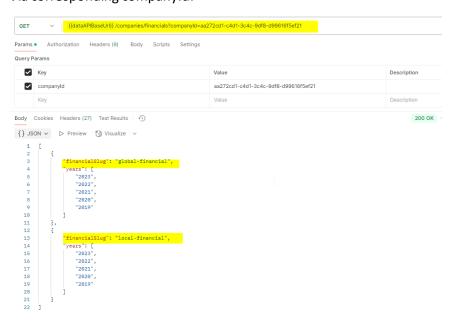

Response: all reports products available for the specified company and visible based on contract

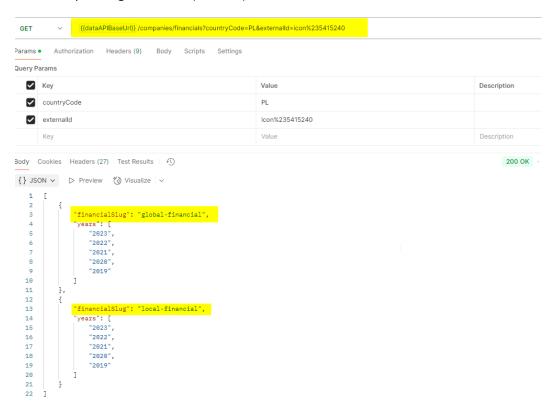

Check available financials:

Via corresponding companyId:

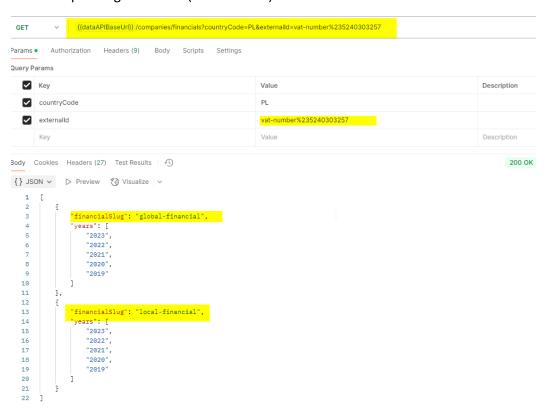

Via corresponding externalId(iconNo):

Via corresponding externalId(vat-number):

1.4. Request company identification.

In case you not managed to identify wanted company, you have the option to request to Coface a company identification and then to order needed product. You need to do it in 2 steps: first step is to request company identification and the second step is to order a product for it. Please check below the 2 steps (sections 1.3.1 and 1.3.2)

1.4.1 Request the identification.

Endpoint to be used: **POST** {{dataAPIBaseUrl}}/companies/identifications

No parameters are required, but inside the request body, some information is required to be provided:

- at least one of the externalID needs to be provided OR
- for some countries where no legal identifiers are needed, it is enough to provide the address.countryCode in combination with: name, address.postalCode and address.city.

In case the provided information is not correct, response will be 400 Bad Request.

Remarks: Information about which countries and what legal identifiers need to be provided for each country, you can find via endpoint:

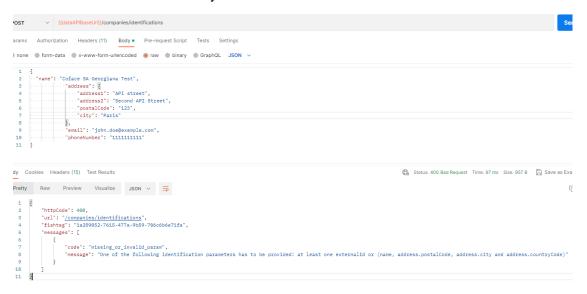

GET {{dataAPIBaseUrl}}/companies/repositories?countryCode={XX}.

For each identifier, there are 2 fields which show if is needed to be provided for a company identification or not and under which format:

"isMandatoryCompanyCreation": true,

"repositoryFormat": "VAT number or statistical number or registration number must be entered, there are no rules for r egistration number."

Error case: no address.countryCode

Success case- Request body:

{

```
"name": "Coface SA",

"address1": "2 rue de Siam",

"address2": "Bâtiment B, Escalier C",

"postalCode": "qui",

"city": "BREST",

"countryCode": "FR"

},

"email": "john.doe@example.com",

"phoneNumber": "0102030405",

"externalIds": [

{
    "id": "123456",
    "repositorySlug": "easy"
    },
    {
    "id": "123456",
    "repositorySlug": "icon"
    }
}
```

If based on the information provided, ICON identifies the company, then the response will provide the info about searched Company in the field *matchingCompanies* together with status *"identified"* in the field *"status"*:

```
Authorization New Authorization New York States Settings

Frome Tom-data Seven-form-undercoded Fram Settings

Frome Tom-data Seven-form-undercoded Fram Settings

Frome Settings Seven-form-undercoded Fram Settings

From Settings Seven-form-undercoded Fram Settings

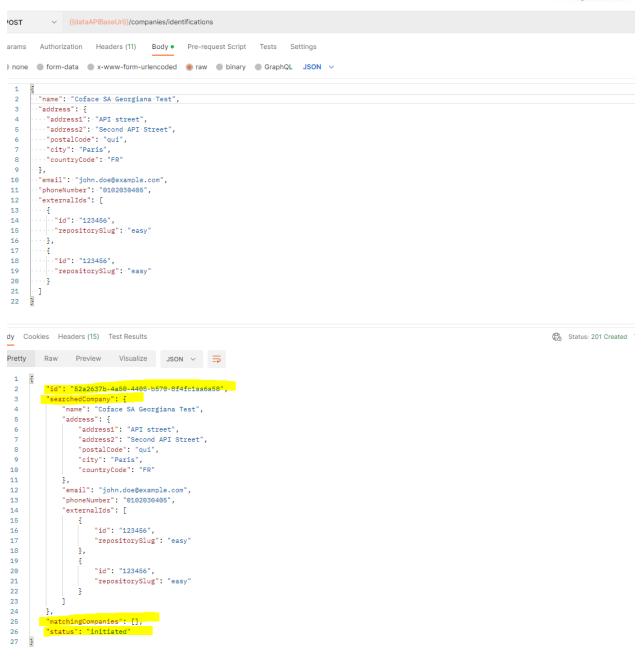

Fram Settings Seven-form-undercoded Fram Settings Settings

Fram Settings Settings Settings Settings Settings

Fram Settings Settings
```

If ICON cannot identify the company based on information provided, response will contain: *id* (which can be used for a future ordering), *searchedCompany* element containing company data provided in the request, *matchingCompanies* element which will be empty and *status* element with value" initiated".

1.4.2 Request the needed product.

The second step that needs to be done is to order the wanted product for this company, even if it is not yet identified.

See details under 1.4.2 Ordering a product for a company not identified.

Remark!! Once you do also this step, the corresponding identification request is not appearing anymore as open, and it will not be returned anymore by any endpoint. The future status of the

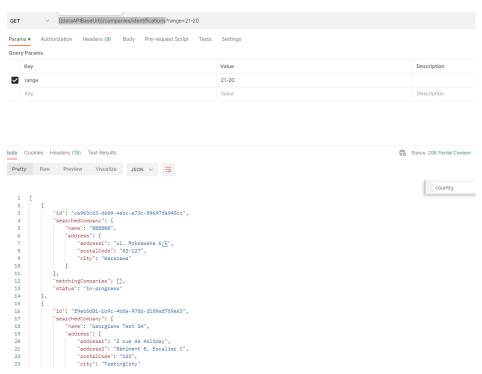

investigation is given actually by the status of the order placed on this step, ordering the wanted product. When order is finished, then either the company was identified, and product content can be downloaded, either the company could not be identified and product content it will be a so-called Negative report containing information about reasons of no identifications.

1.4.3 Request all identifications

All open requests to identify companies made by your profile are shown under endpoint:

Please be aware that API is returning all **open** identifications, meaning all identifications which were not yet used (companyIdentificationId) to order a product with them.

Once you do also the second step, ordering a product via companyIdentificationId, the corresponding identification request is not appearing anymore as open and is not returned anymore by this endpoint.

1.5 Ordering a product

The structure of the request depends on the result of searching/identification of company.

1.5.1 Ordering a product for an identified company:

Remarks!!

1. Slugs and product codes

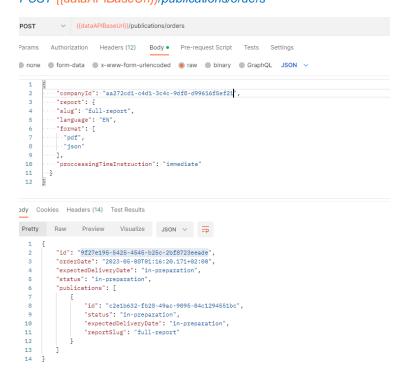

Attention: for DRAGON products (DRA, CO, AO) availability is not immediate. Therefore *processingTimeInstruction* option should have value immediate_if_available_inquiry_otherwise or inquiry with investigationSpeedLevel: normal.

2. Format of reports

API allows to request report in different formats such as JSON, XML, PDF or HTML. For JSON and XML it will require additional mapping on customer side to integrate structured form of data to his own system needs.

 Ordering a product can be made either using the internal companyld value returned by the API in one of the previous commands (the ones for identifying the company) OR using one of the externallds (same, they are returned by the API when identifying the company)

a. Ordering a Full Report via companyId: POST {{dataAPIBaseUrI}}/publications/orders

b. Ordering a Snapshot report (light report) via externalld: POST {{dataAPIBaseUrl}}/publications/orders

```
\[
\left\{\left\{\left\{dataAPIBaseUrl\}\}\\/publications\right\)
\[
\text{orders}
\]

```

c. Ordering a Sector Risk Assessment

When ordering a SRA product (Sector Risk Assessment) you need to consider the following:

- If in the moment of placing the order, we do have already in ICON database information about the sector of the company, then you can place the order without mentioning the sector/nace code. If this is the case it can be checked if naceCode information is present when identifying the company.
- If in the moment of placing the order, we do not have such information, then:
 - either you can provide in the body of the request the corresponding sector,
 - either a business report needs to be ordered so that we can have in our database the corresponding sector
 - otherwise, the order will be rejected, as we would need to protect against a massive number of orders which would need to be worked manually.

Checking if company has already Nace Code in ICON database:

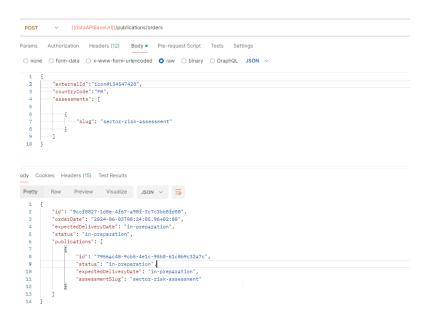

GET {{dataAPIBaseUrl}}/companies?countryCode=FR&externalId=icon%23134547428

```
Body Cookies Headers (15) Test Results
 Pretty Raw Preview Visualize JSON V
                    "id": "d93728d6-acc7-3033-a83c-8120f16a937b",
                     "name": "COFACE".

                              "countryCode": "FR",
"main": true
    26
27
```

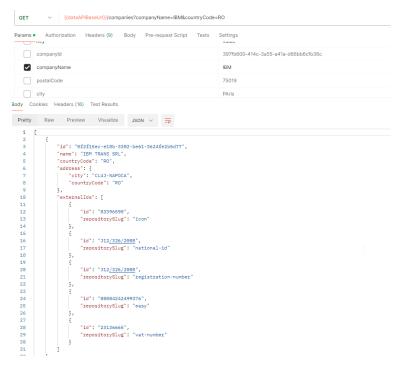

For this company, ordering a SRA is possible without providing the NaceCode inside the body of the request:

POST {{dataAPIBaseUrl}}/publications/orders

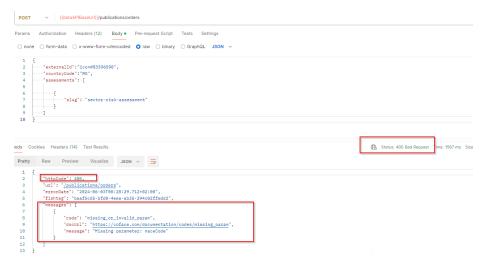

Sample of company which does not have Nace code in our ICON database in the moment of ordering:

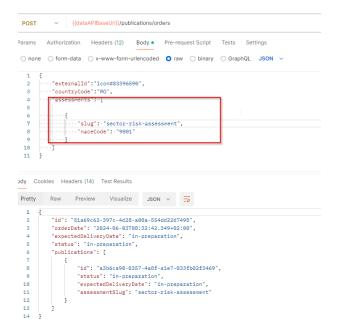

If we would want to order a SRA for this company, without providing the sector, order will be rejected:

Now there are two options:

- Either we order a SRA product mentioning the sector of the company in the body of the request:

- either a Full Report is ordered, so that we will obtain the naceCode and save it in our database. If after ordering a Full Report, naceCode is known and received, it will be saved into our database, and then a SRA can be ordered.
- But it could be also cases, that even after ordering a Full Report, naceCode remains unknown. Then for sure the order is still rejected. We could not provide a Sector assessment if we do not have the Sector.

d. Ordering Financial products

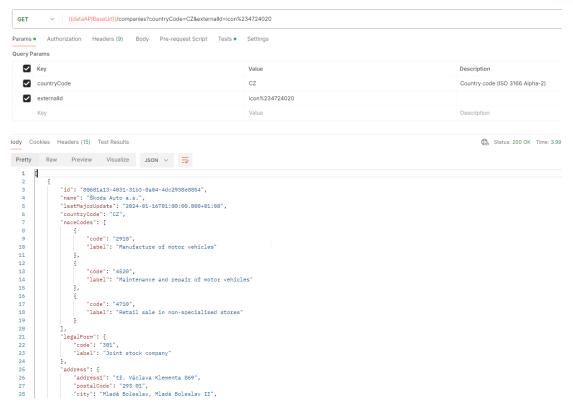

When ordering financial products please consider that initial steps for searching and identifying the company should be performed also here. Please check section <u>1.2 Search a company</u> (identification of a company in the database) for more details.

If you identified your company you can order via one of the possibilities mentioned : via companyId, or via one of the externalIds, iconNo or VATNo, etc.

We will treat here the case that we identified the company, and we have the iconNo:

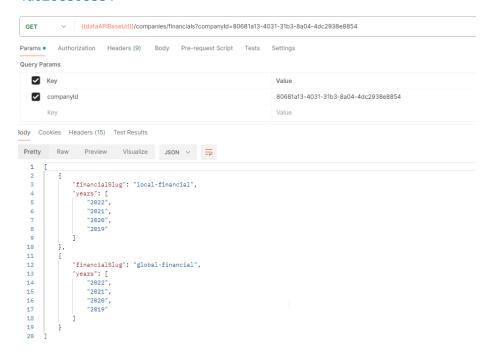

GET {{dataAPIBaseUrl}}/companies?countryCode=CZ&externalId=icon%234724020

The most important step is to check if ICON do have the financial information available for this company and which are the years. This can be done via products endpoint. Here we will use the companyld from above response:

GET {{dataAPIBaseUrl}}/companies/financials?companyId=80681a13-4031-31b3-8a04-4dc2938e8854

Response will contain the years for which the financial information is available.

Now, we will order via one of the externalld, and we will choose iconNo:

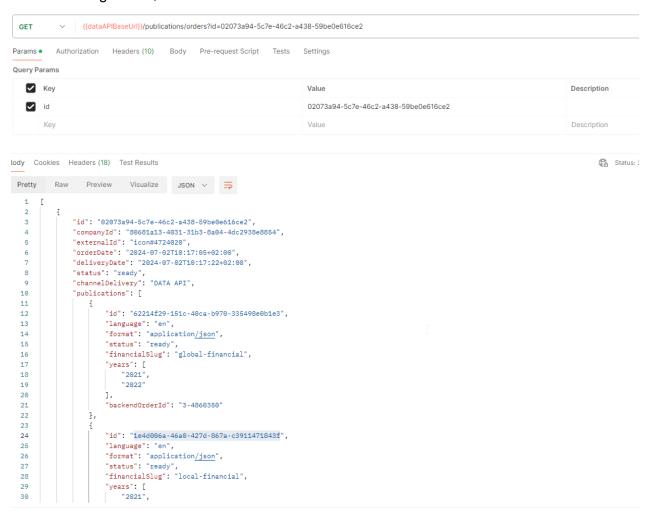

POST {{dataAPIBaseUrl}}/publications/orders

```
{{dataAPIBaseUrl}}/publications/orders
 POST
Params
        Authorization
                      Headers (12)
                                    Body •

 20
```

Request body should contain the "financials" section where the "slug", "currency" and the "years" values must be specified as in the above sample.

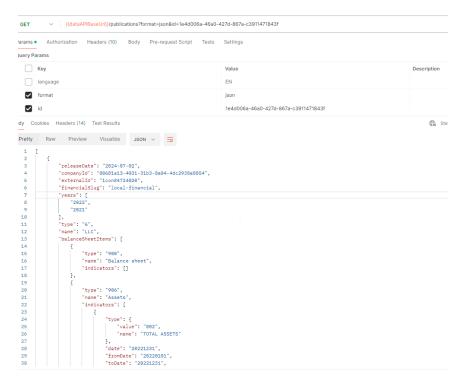

Response is containing the global id and ids of the orders placed, as for all the other products. Now with the global id, can be checked the status of the order:

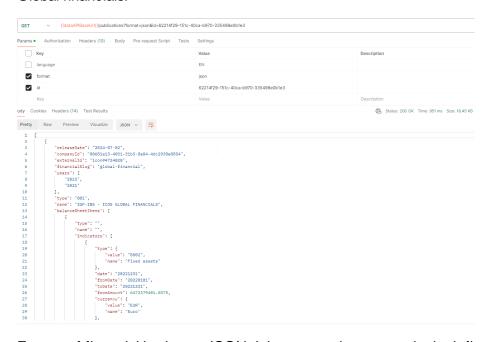

And with the publication ids, the content of each financial product can be downloaded.

Local financials:

Global financials:

Format of financial is always JSON. It is not mandatory to order both financial products, only one can be ordered. In POST request then, user will put only the wanted slug.

1.5.2 Ordering a product for a company not identified.

Prerequisite: you need to request an Identification of the company for which you need to order (See section **1.3.1 Request the identification)** so that you have the companyIdentificationId returned by ICON.

Endpoint to be used:

POST {{dataAPIBaseUrl}}/publications/orders 0

POST {{dataAPIBaseUrl}}/monitorings/orders

Request body:

No parameters

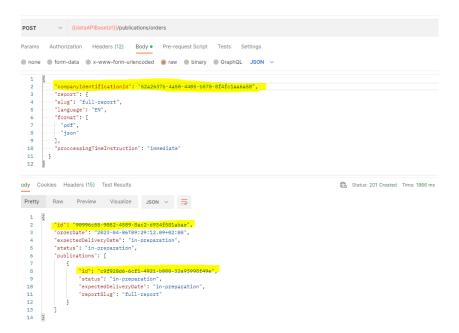

Body of the request should contain mandatory information: *companyIdentificationId*, product section, which can be "*report*" or "*assessments*" or "*financials*"

More details and explanation for fields that need to be present for each of the section, can be found behind each element from swagger, by clicking on Model and after that, on arrow down for each drop down that is available.

Swagger can be found under AWS Dev portal: https://devportal.coface.com/apis/qves74kqv0/v1

Response is the same as when ordering for an identified company. From here, all the other steps can be performed: get status of the order and, when ready, get the content of the order.

1.5.3 Ordering a product using Callback mechanism.

Callback mechanism is provided by Coface API in case the order was not finished immediately. Therefore, we offer the customer the possibility to be announced when the order is completed.

Ordering a product using the callback mechanism has exactly the same steps as described under section 1.4.1 Ordering a product for an identified company

The only difference is the fact that in the body of the request one more field is added, *callbackUrl*. In this field, an URL address is given as input by the customer. "*callbackUrl*" field should be placed outside of any of the sections "report", "assessments" or "financials".

More details and explanation for the field can be found inside swagger, by clicking on Model and after that, on arrow down for each drop down that is available.

Swagger can be found under AWS Dev portal: https://devportal.coface.com/apis/qves74kqv0/v1

How it works: We have a "callback" job which is running on each minute, and for all orders which are finished by that moment, and they were marked as orders with callback (based on the value from http request), we sent one ping to the corresponding URL. We do not provide anything to customer server via that call, no info about the order or about the product. It is just a ping to URL provided, and we will retry several times (16 times) if the URL is not available. We are not having any authentication method when calling the URL.

When customer receives a ping on the corresponding URL, it can access the corresponding Endpoint of the API to download the content of the product.

Callback retry:

The maximum number of retries for a callback is 16.

The rule to establish if the request will be **scheduled again** is the following:

If the status code of the response is **NOT** between 200 and 299(inclusive)

Every request has a timeout set for 10 seconds. So, after 10 seconds, if the client server doesn't respond, we automatically close the request, and a new one will be scheduled.

To calculate the **next request time**, it applies the following algorithm:

```
If tryNumber is > 8 then we try again in 8 hours.
Else the next try is in 2^tryNumber minutes:
// 1 - 2 - 4 - 8 - 16 - 32 - 64 - 128 - 256 min, where tryNumber starts from 0.
```

Practical example:

```
If it was the first request and failed, the next one will be scheduled after 1 minute. (tryNumber = 0)

If it was the second request and failed, the next one will be scheduled after 2 minutes. (tryNumber = 1)
...
```

...

If it was the 9th request and failed, the next one will be after **256 minutes.** (tryNumber = 8) If it was the 10th.. 16th request, the next one will be set after **8 hours.** (9 <= tryNumber <= 15.)

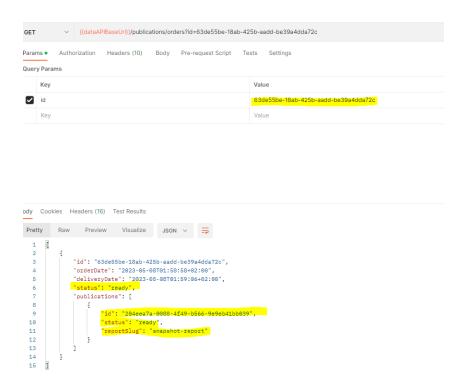

1.5.4 Checking order status

After using the POST method, customers get as response a JSON structure containing:

- one id which allows checking the status of the order (initial status of request is "in-preparation")
- "publications" section containing all products ordered in same order. All of them have this initial status "in-preparation."

In order to check the status of the whole order, first id value must be used for endpoint GET /publications/orders?{id}

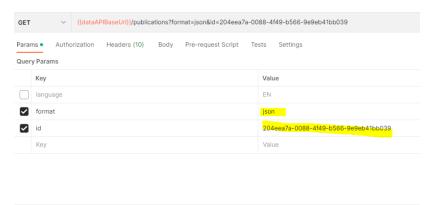

Status of the order will be ready if all publications of the order are ready. If one of the publication is not ready, the status of global order will be still "in-preparation".

Attention! Only when status of the order / publication will be "ready" you will be able to retrieve the content of the corresponding product ordered (publication)

1.5.5 Retrieving the data

If order is finished, customer can call method *GET /publications?format*={format}&{id} Format and id parameters are mandatory. Format should be the one used when POST call was made and id should be the id returned in "publications" section returned by API on POST method.

1.6 Request Monitoring/ Ordering a monitoring product

Customers can request monitoring by ordering one of the standalone combined products:

Full Report with Monitoring,

Snapshot Report with Monitoring,

DRA with Monitoring,

Credit Opinion with Monitoring,

Advanced Opinion with Monitoring,

Country Risk Assessment with Monitoring,

Sector Risk Assessment with Monitoring.

Late Payment Index with Monitoring

These are only some of the standard products that can be ordered. If they do not meet your needs, please get in touch with us to provide a more extended offer.

Monitoring remarks:

- Only identified companies can be monitored. You cannot request a monitoring together with a company identification request.
- By default, Monitoring should last 12 months.

-

1.6.1 Ordering a monitoring product without a callback mechanism for the notifications

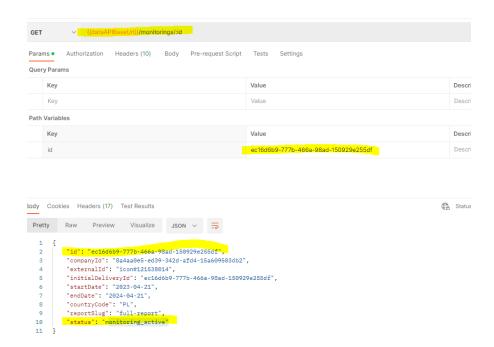

Endpoint *POST* {{dataAPIBaseUrl}}/monitorings/orders needs to be used, using the slug/product id returned by API when company was identified, and available products were returned. Please check 1.3. Check product availability section for availability of the products.

placing the monitoring order:

```

```

- response content: Id of the monitoring order, start and end date of the monitoring, status (which is "in-preparation"), expectedDeliveryDate, companyId, country Code, product for which monitoring was ordered and also the callback URL to be used for calling when notifications are generated.
- check the status of this order using endpoint GET {{dataAPIBaseUrl}}/monitorings/:id

- If the request is successful (status is "monitoring_active") then the company starts to be monitored, and the content of the product can be already retrieved (see <u>1.7.3 section</u>)
- When a change happens on this company, a monitoring notification is generated, and we are announcing this via callback mechanism: a GET call is done on the provided URL (value of the field "notificationCallbackUrl") This call is just a ping call and no other information is pushed. See details under 1.7.4 Retrieving monitoring notifications

1.6.3 Retrieving content of the report / product ordered via monitoring order

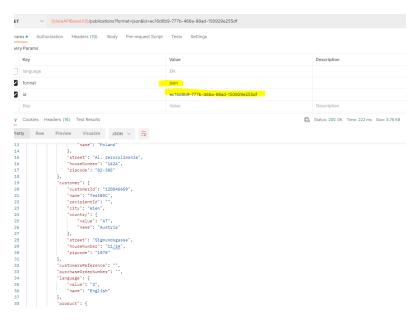

Because a combined product was ordered, we can also retrieve the content of the product ordered.

Using the id returned by the POST monitoring order (see 1.7), we are getting the content of the product using endpoint *GET* {{dataAPIBaseUrl}}/publications?format={}&id={orderId}, where:

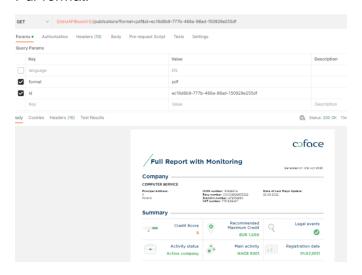

- orderId is the id returned by API when posting the monitoring order
- format parameter is mandatory. As we ordered in 2 formats, we can retrieve both (reminder: Business Reports double format is available only for specific list of countries)

JSON format:

Pdf format:

1.6.4 Retrieving monitoring notifications.

As a customer which ordered monitoring (you have companies monitored) you will need to fetch the changes which are happening in these monitored companies, so called **Monitoring Notifications**. There are 2 ways of doing this:

- using notification Callback mechanism OR
- pulling regularly the notifications.

The only difference between the 2 ways is: for the first way you will perform actions to get the notifications only after callback ping is sent to already provided URL, while for the second way, you will perform actions to get the notifications without any trigger. You can interrogate when you want, depending on your need. You can do it regularly: daily, weekly, etc.

Please check this section how to configure a notification callback.

Notification CALLBACK Remarks:

- If you have this mechanism configured, then in the moment a notification is created on our side, for this order, the provided URL will receive a ping from Coface side.
- Ping call does not push any information (content or meta-data about the order) and does not have any authentication mechanism.
- Notifications are created and pushed once per day

If you used a notification CALLBACK mechanism when placing the monitoring order, then you will do the steps below **triggered by the ping received in the provided URL**.

If you did not use notification CALLBACK mechanism when placing the monitoring order, then it is up to you to implement a scheduler to do actions described below, depending on your need.

Steps to be done for getting the notifications (independent if you used callback mechanism or not):

Step 1: check via notification Endpoint which notification was received. Call can be made using several parameters in order to have a more feasible response. It can be done using data filter (to obtain all notifications per day or per specific period) OR via following filters: product/order/company/customerReference/channelDelivery

Requests:

Getting all notifications daily:

GET {{dataAPIBaseUrl}} /notifications?deliveryDateFrom=2024-07-29&deliveryDateTo=2024-07-29

Getting all notifications for a specific product, any company, from the beginning of the monitoring:

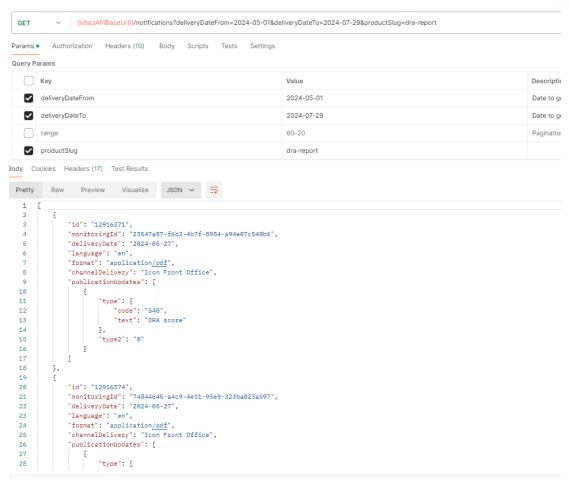

GET {{dataAPIBaseUrl}}/notifications?productSlug=dra-report

Getting all notifications from a product in a specific period:

GET {{dataAPlBaseUrl}}/notifications?deliveryDateFrom=2024-05-01&deliveryDateTo=2024-07-29&productSlug=dra-report

Response:

Contains an array of all notifications requested. Number and type of notifications depend on filter used in request. It can have all notifications for one product but for all companies, for all products all companies, or other combinations of filters.

Each notification will have: id of the notification, id of the monitoring order, deliveryDate, format, language, channelDelivery, callbackUrl and publicationUpdates object.

The content of publicationUpdates object, depends on which product the notification belongs to. We can have the whole new content of the product or just some highlights of what have been changed.

Step2: For each notification received, take the id and the format of the notification, and get the content of the notification via corresponding endpoint.

Request:

GET {{dataAPIBaseUrl}}/notifications/:notificationId/content?format=json

2. Use cases

2.1 Ordering multiple products for same company

2.1.1 Ordering 2 assessments in one call

You want to order some products for Audi Company in DE

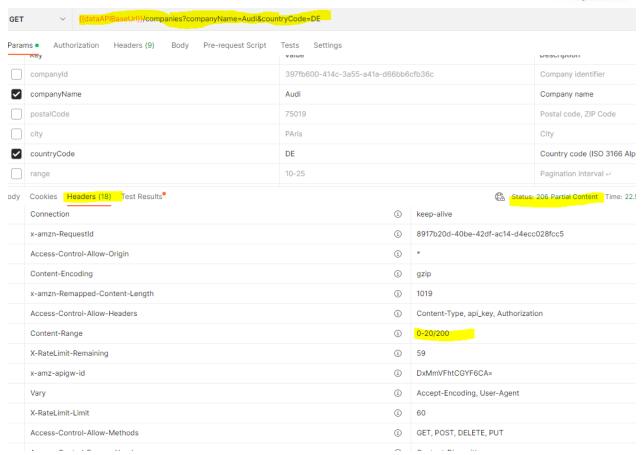

First step is to search, using company name and country code, as this is what you know currently:

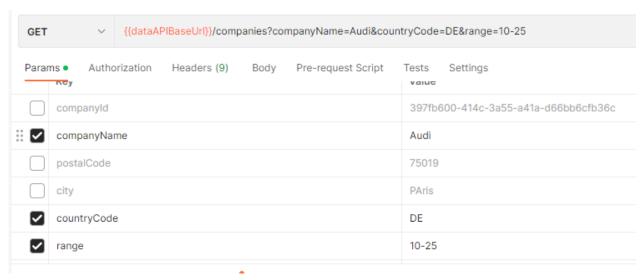

Call is sent to one of our providers (the one to which your customer profile is routed to). Provider is returning all results that it has with this name and country code. In this case, API returned 200 results.

Per page we have 20 results, and pagination is in place (you can see the 206 partial content, and headers values highlighted below):

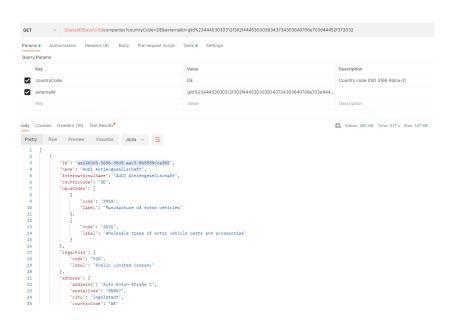

You have 200 results. In order to check others which are not in first page, you need to use the range parameter. We are showing max 20 results per page.

Now, out of 200 companies, you need to identify one of them in order to order some products.

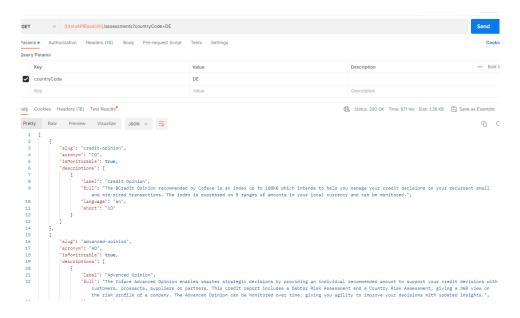

There are 2 ways: either you choose one, and take the giid value and use it as externalld parameter and make the order with it, OR, you make one more call and uniquely identify the company and then you can order using another identifier replied by API (vat number, companyId, icon no)

Now, company is saved into ICON, and has more identifiers associated: easy, icon nr, companyId, etc.

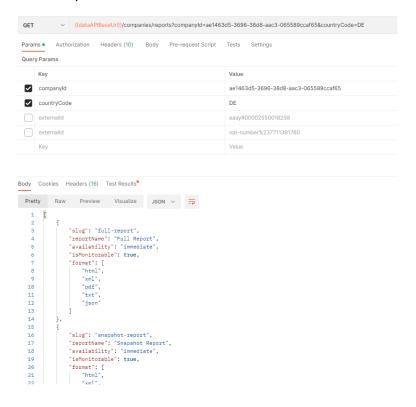

In this moment, you need to check and see what the available products are for this company, together with their availability (immediate or on-order):

Check assessments:

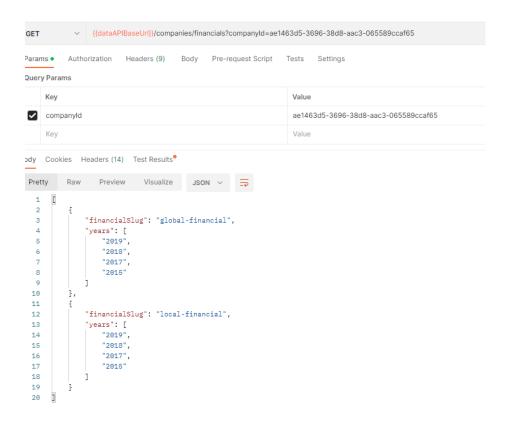

Check reports:

Check financials:

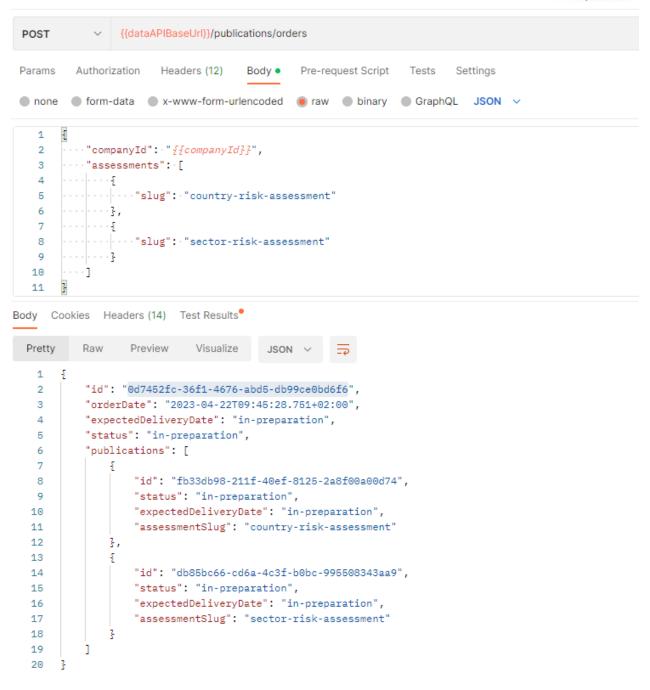

Now is time to order:

Ordering 2 assessments: Country Risk Assessment and Sector Risk Assessment in same call:

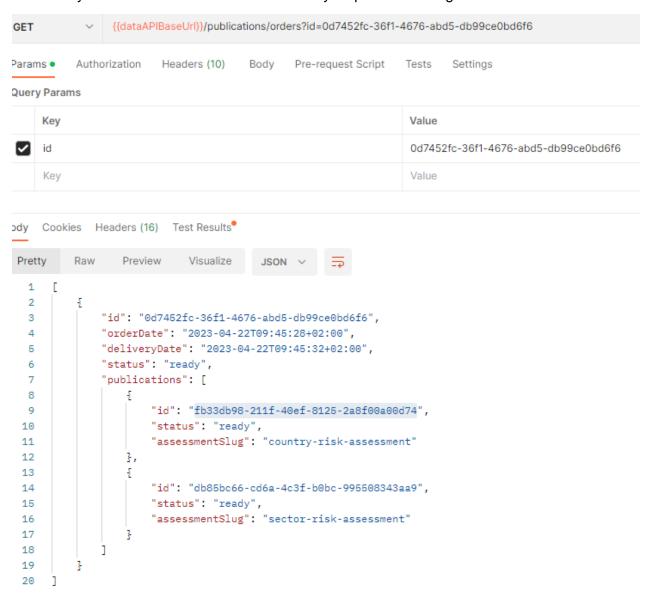

As we ordered 2 products in one order, in the response, we will get one global id of the order, first id from json and 2 ids corresponding to each product ordered.

Response of the POST call, will return status "in-preparation" if request is correct on first validations. But even if API returned Ids and "in-preparation" status, it might be that due to some technical or business reasons the order to not be created at all in the backoffice or to be cancelled.

If , for example we order a product with instructions :"immediate" but the product was not available immediate, the call of POST order returns ID and status "in-preparation" in first phase, but when trying to call the status of the order, it can be cancelled, or answer can be an empty array, as order was not at all created in backend.

This is why we have the status call as mandatory step after ordering::

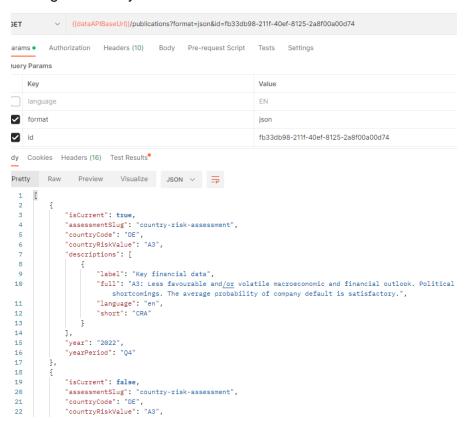

As both publications are ready, CRA and SRA, you can get now the content of the products, but with a call per each product.

Getting the sector risk assessments:

Getting the country risk assessment:

For ordering more products in one call, there is a request called URBA products inside postman collection on https://coface.github.io/DataAPI.html#documentation

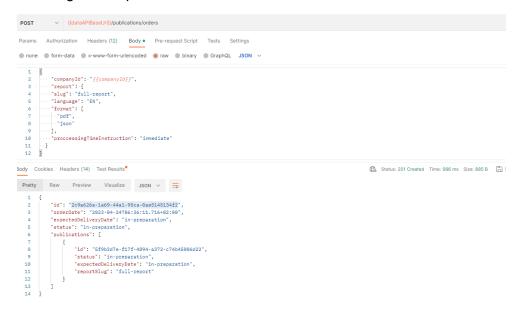

2.1.2 Ordering other products for the same company

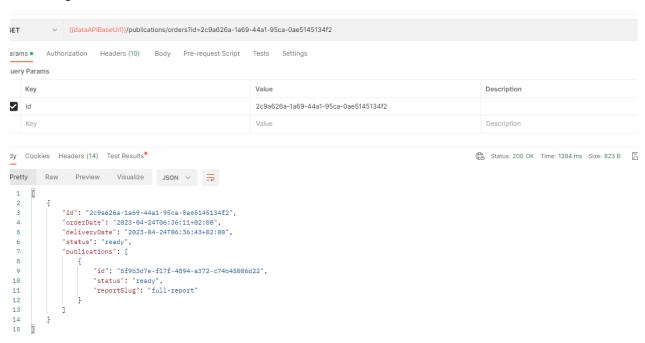

You can order now also reports.

We saw earlier when we checked the availability of the products that full report and snapshot report are immediate. Let's order them:

Ordering a full report:

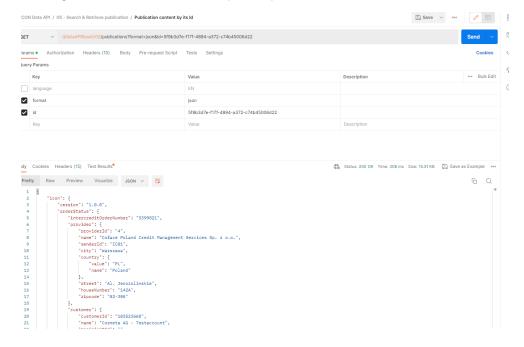

Checking the status of the order:

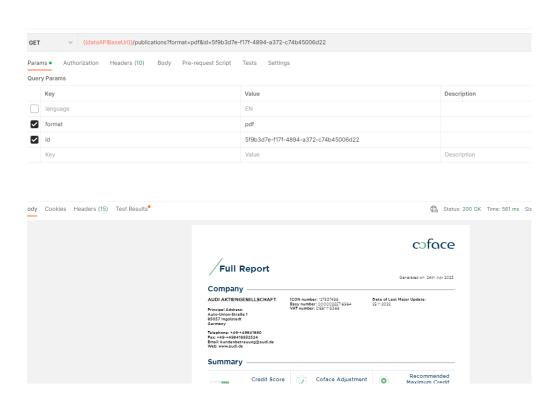

Getting the content of the full-report in json:

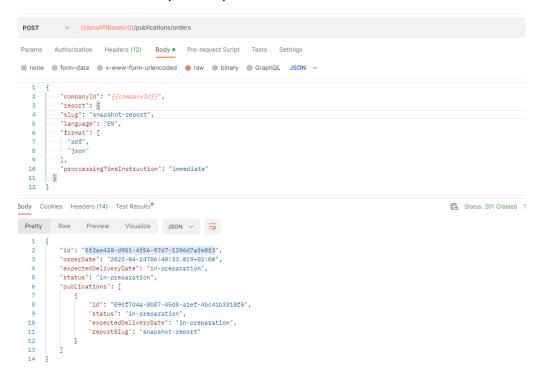

Getting the content of the full-report in pdf:

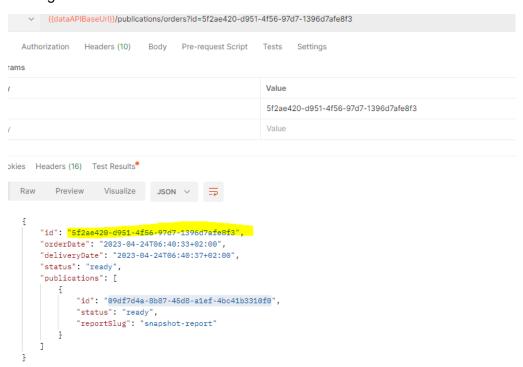

Now, let us order a snapshot report:

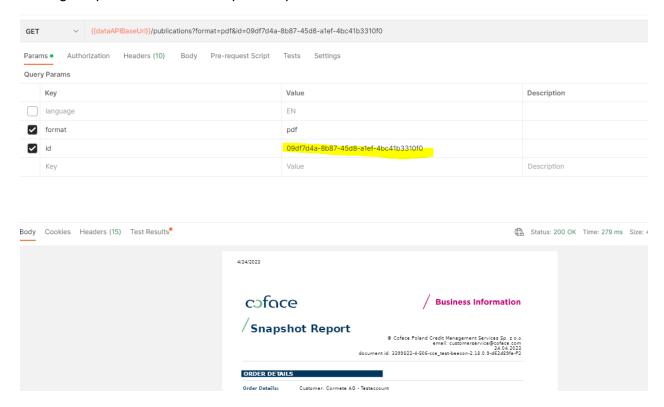

Getting order status:

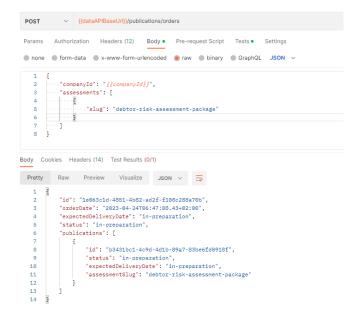

Getting the pdf format of the snapshot-report:

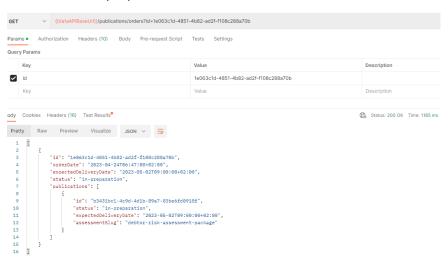

Let us now order one last product, Score product, DRA- package, which is the score with 5 years history:

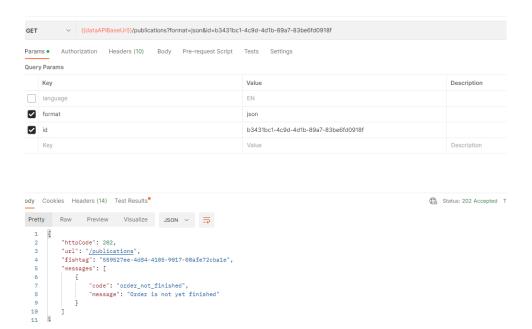

As this is not an immediate product, and can take a little bit of time until is ready, first check status is still in-preparation:

If I am trying to get the content now, via /publications endpoint, it will not be ready:

But we do have the expected delivery date which is the maximum SLA for the product to be available.

2.2 Ordering Late Payment Index product for a company

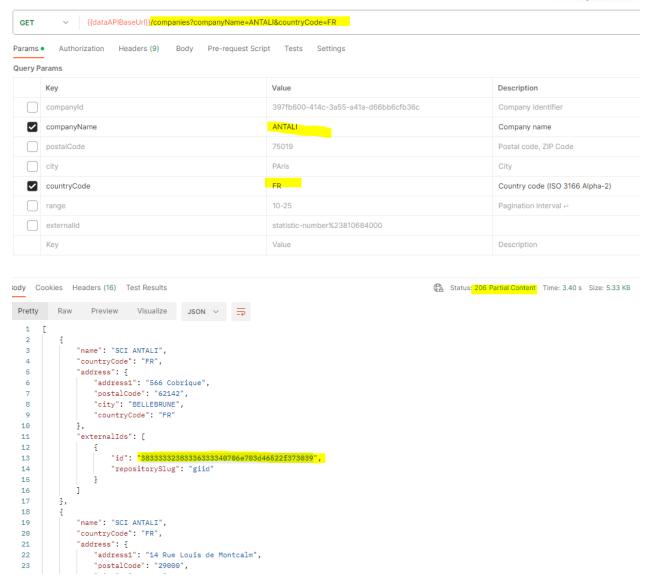

You want to order Late Payment Index for Antalis company in FR

First step is to search, using company name and country code, as this is what you know currently:

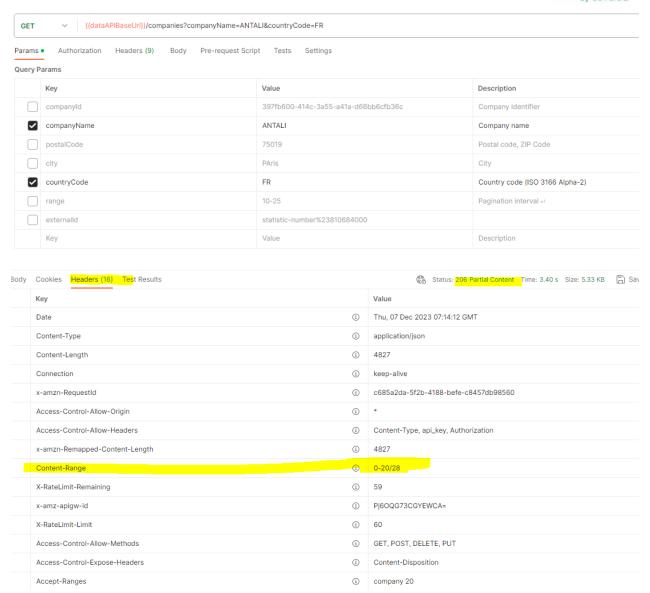

Call is sent to one of our providers (the one to which your customer profile is routed to). Provider is returning all results that it has with this name and country code. In this case, API returned 28 results.

Per page we have 20 results, and pagination is in place (you can see the 206 partial content, and headers values highlighted below):

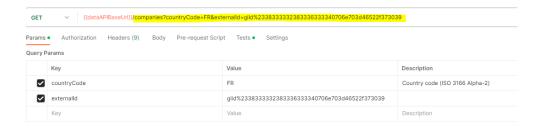

You have 28 results. In order to check others which are not in first page, you need to use the range parameter. We are showing max 20 results per page.

Now, out of 28 companies, you need to identify one of them in order to order some products.

There are 2 ways: either you choose one, and take the giid value and use it as externalld parameter and make the order with it, OR, you make one more call and uniquely identify the company and then you can order using another identifier replied by API (vat number, companyId, icon no)

We are presenting below the second option:

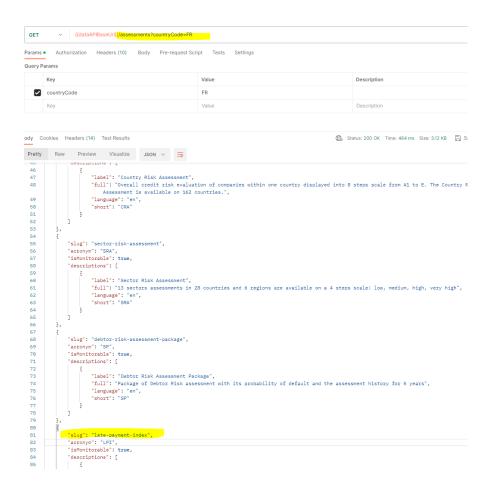

Now, company is saved into ICON, and has more identifiers associated: icon nr, registration-number.

In this moment, you need to check and see what are the available assessment products for this company, together with their availability (immediate or on-order). Late Payment Index should be returned:

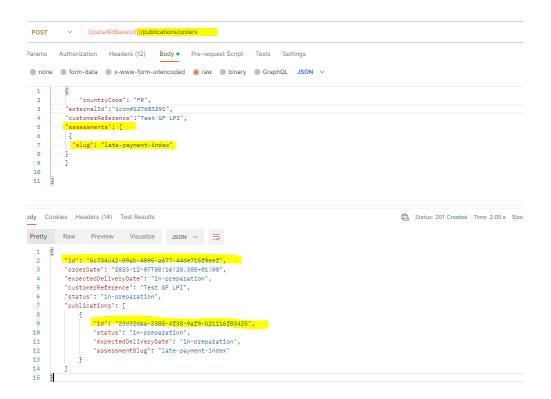

Now, you can order the product for this company:

You can use any of the well known options: via companyld (if exists), via other externalld: iconno, vat number, etc.

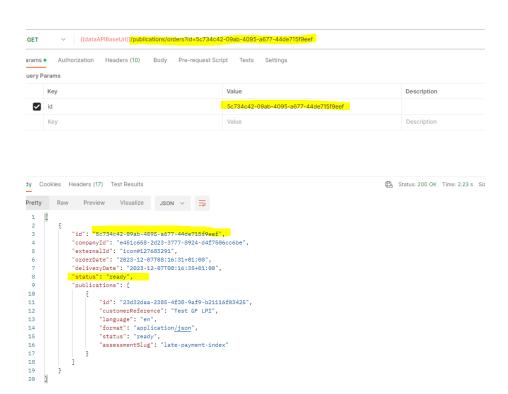

Ordering process is started. Fron now on, you are following the well known process: check the status of the order and then get the content.

Check the status of the order: GET /publications/orders?{orderId}

If the status is "ready", you can get the content of the product:

GET /publications?format={format}&id={publicationId}
